Pero degreaser help Tenable turn the screw on SED

When the solvent emissions regulations (SER) came into force on 31 October 2007, turned parts specialist Tenable Screw Co Ltd had already decided to take early measures to avoid potential fines by replacing a non-compliant Pero solvent degreasing machine with a new Pero V1 universal solvent degreaser from sole UK agent Kumi Solutions Ltd.

"This particular **22 year old machine** simply didn't meet the emissions," states Norman Runciman, facilities manager. "We have a number of Pero machines already and they perform really well, so it was a fairly **natural choice to acquire the Pero V1 Universal as a replacement.**"

Another advantage considered attractive to Tenable Screw is that the machine can be used with all solvent types, hence the word 'universal' as its model suffix. In fact it is possible to swap from chlorinated hydrocarbons to hydrocarbons in a single day. Although Tenable Screw's current focus is firmly on the former, Mr Runciman confirms that with constantly amended legislation, the move may prove fruitful in economic terms in future years.

The Pero V1 works at full tilt across a single day shift at the company's Marlborough site in Wiltshire. It is used to clean components ranging across Tenable Screw's size range. Each basket can be loaded up to 80kg – the V1 is able to process **6-10 basket loads per hour** depending on selected cycle.

"This is a significant investment for us," states **Simon Schlaefli, Managing Director.** "The V1 was the most practical and suitable choice for our application available on the market. Whilst we have bought the machine in order to comply with the SER, ultimately our customers will benefit. Providing customers with good presentation of parts is undoubtedly an increasingly important factor. **Today all customers expect components to be super clean.**"
